

It's in
your
hands.

No matter how tiny they are, small
devices and batteries do not belong
in residual waste

Electric power tools, electronic toys, razors and
remote controls may be small and handy, but un-
fortunately often end up in household waste when
they break down. Yet besides valuable raw materi-
als, even small electrical appliances contain danger-
ous substances as well as rechargeable batteries
that have no place in residual waste as they can
cause a fire.

Off to the collection point

Small appliances include almost all portable elec-
trical devices, such as irons, mixers, coffee ma-
chines and radios, but also tools such as drills or
hand-held circular saws, as well as all computer
accessories such as keyboards, printers, mice, USB

sticks, telephones and headsets, simply put, all
devices whose longest rigid side edge is no longer
than 50 cm.

Small devices – high value

All products that flash, light up, make a noise or move
are powered by (rechargeable) batteries, and at the
end of their lives, they have to be taken to one of the
roughly 2000 collection points around Austria. There
they can be handed in simply, easily and free of charge
during opening hours. Before taking your electrical
device to the collection point, please remove the (re-
chargeable) batteries as these are recycled separately.
Please also note: many devices can still be repaired
and used again. Re-Use is useful.
